

# Lab7\_Q1: Recursive Binary Fractal Tree with Python Turtle

## Problem

Write a recursive program that draws a *binary fractal tree* using *Python turtle*.

Requirements:

- At each node you must draw two child branches. The left branch is turned  $+60^\circ$  relative to the current heading, the right branch  $-60^\circ$  (i.e. the two branches are  $120^\circ$  apart, each at  $\pm 60^\circ$  from the trunk).
- Branch lengths should decrease by a constant scale factor each level (for example `scale = 0.7`).
- The recursion must stop when `level == 0`.
- The tree can start from the bottom center of the screen and grow upwards.
